PROJECT PROPOSAL

Argus — AI Steward for UGREEN AI NAS

UGREEN Hackathon 2026 on AI NAS · Round 1 Submission

Track	Open Innovation
Entrant	Helmut Chaparro Sandoval — individual entry
Residence	Bogotá D.C., Colombia
Deliverable	AI Skill package per the Uliya Skill Development Standard

1. What does your Skill do? (one sentence)

Argus, the hundred-eyed steward, audits authorized NAS folders for duplicates, suspicious files, storage waste and disorganization; it proposes a numbered, approval-gated action plan, executes only what the user confirms, and keeps a journal it can diff and undo.

2. Target user and problem

Home and prosumer NAS owners whose folders silently decay over time: duplicates accumulate, scans stay unclassified, space is wasted, and suspicious files go unnoticed. They need order with evidence and a way back — not a black box.

3. Solution

Argus is a Markdown-only Uliya Skill that runs a nine-phase audit, presents one numbered plan, executes only the approved items, and records a dated journal entry with an undo manifest, a dashboard, and a health score.

4. Core user flow

The user says "Argus, audit Documents"; Argus reports its findings and presents the numbered plan; the user replies "all" or selects items; Argus executes and reports the score and journal path. Later runs answer "what changed?" or "undo the last run".

5. Differentiation

Published skills are single-purpose and stateless: they run once and forget. Argus adds steward memory, a journal with run-over-run diffs, reversibility through its undo manifest, a deterministic suspicious-file rule set, and a health score, forming one coherent steward rather than five separate tools.

6. NAS capabilities used, and where

file-agent inventories, deduplicates, moves and tags (`ug-filesystem`, `ug-filemgr`, `file-workflow`) in phases 1–5 and 8; document-agent classifies and extracts fields (`ug-document`) in phase 6; knowledge-agent stores the run digest (`ug-knowledge`) in phase 9; photo-agent supplies OCR and media metadata (`ug-photo`); security-monitor-agent summarizes camera events (`ug-surveillance`). The local AI model backs classification; data never leaves the NAS.

7. Technical approach

The parent SKILL.md delegates self-contained instructions to six registered experts over published CLI families (catalog v2.0.0). Deterministic rules turn expert evidence into verdicts; low-confidence items route to review; every mutation requires explicit user approval. Inputs: scope paths and mode. Outputs: the plan, executed changes, journal, undo manifest, dashboard, and score.

8. Current status

Complete and statically validated: SKILL.md plus seven linked references (capability map, heuristics, conversation protocol, journal format, user guide, test plan, disclosures) pass the official checker with zero errors and zero warnings. Remaining: on-device validation of delegation depth, quarantine semantics, and journal read-back.

9. Validation plan

Core 1: Full-audit on a synthetic messy folder: verify plan accuracy, approved execution, journal and undo manifest, and one reverted item.

Core 2: File-this on a scanned invoice: correct classification, rename, filing, and journal entry. Edge — empty folder or first run without a journal: clean empty result, no invented diff.

10. Limitations and risks

Argus flags suspicious files for review; it is not an antivirus. Large scopes run sampled and paginated. Journal fidelity depends on the metadata exposed by supported capabilities, and the single assigned testing day limits on-device tuning.

Annex — Declarations (outside the 500-word limit)

Entrant: individual — Helmut Chaparro Sandoval. Bogotá D.C., Colombia.

Consent: I confirm this submission is my original work, developed during the Hackathon period, and I agree to the Official Rules. — Helmut Chaparro Sandoval

Third-party components and licenses: none. Argus ships Markdown documentation only and uses published UGREEN NAS capabilities; no external libraries, services, or data flows.

AI tools used: UGREEN UGOS Skill Creation Tool v0.7.3 (Sponsor-provided; capability consultation and static checks); Devin (Cognition), AI coding assistant, for drafting and validating the Markdown — all output reviewed and edited by the entrant.

Author's license: the entrant's original work is intended for publication under the MIT License.
